                                                                                                                                                       clone pAt2301 containing DNA encoding gibberellin-20-oxidase may be used to construct chimeric genes and binary vectors to transform plants by usual methods, e.g. Agrobacterlum-mediated transfer. Propagated transgenic plants show modulated growth and development e.g. reducing GA-20-oxidase expression with antisense constructs reduces vegetative growth in cereals and grasses, improving resistance to frost, etc. Sense constructs improve fruit set and growth, extended stems and leaves, induce flowering and overcome

exhibiting at least one improved growth parameter, in that a DNA sequence coding for expression of a polypeptide exhibiting plant hormone gibberellin (GA) 20-oxidase activity functionally inserted in the plant genome. The transgenic plant is useful in forest, pulp and paper industries. The transgenic plant has increased growth rate, blomass production and/or xylem fiber length. The ectopic overexpression of GA 20-oxidase gene results in significant changes in growth rate, stem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    volume and xylem fiber length, and thus reduces or eliminates the use of growth influencing chemicals in forestry. The present sequence is Arabidopsis thaliana gibberellin (GA) 20-oxidase CDNA construct.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a transgenic woody plant e.g. a Populus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New transgenic woody plant exhibiting improved growth parameter, useful in pulp and paper industries, comprises DNA sequence encoding gibberellin 20-oxidase activity functionally inserted in plant genome

                                                                                                                                                                                                                                                                                                                                     ре
                                                                                                                                                                                                                                                                                                                       Clone pAT2353 containing DNA encoding gibberellin-20-oxidase may be used to construct chimeric genes and binary vectors to transform plants by usual methods, e.g. Agrobacterium-mediated transfer. Propagated transgenic plants show modulated growth and development e.g. reducing GA-20-oxidase expression with antisense constructs reduces vegetative growth in cereals and grasses, improving resistance to frost, etc. Sense constructs improve fruit set and growth, extended steams and leaves, induce flowering and overcome dormancy, etc. Preferred transgenic plants are maize and wheat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      175 TCTTTAACCCTTCTTCTTTAACCTCCAATCCCAAATCCCAAACCAATTCATTTGGCCAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vectors containing DNA encoding gibberellin-20-oxidase activity are used to construct chimeric genes and binary vectors to transform plants by usual methods, e.g. Agrobacterium-mediated transfer. Propagated transgenic plants show modulated growth and development e.g. reducing GA-20-oxidase expression with antisense constructs reduces vegetative growth in cereals and grasses, improving resistance to frost, etc. Sense constructs improve fruit set and growth, extended stems and leaves, induce flowering and overcome dormancy, etc. Preferred transgenic plants are maize and wheat.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GGCAGGTGGGGAGGCGTGCGAGGCACGGCTTCTTCTTCTTGGTGGTTAACCACGCATCG

                                                                                                                                                                                                                                                                                                                                                      a chimeric expression construct expressing a NNA or protein which suppresses the gibberallin biosynthetic pathway sequence, divarts substrate from the pathway, or degrades pathway substrates or products. The methods uses copalyl diphosphate synthase, 3beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta, 3beta-hydroxylase polynucleotides to achieve this. The method is used to control seed germination and seedling growth especially to requilate gene products of gibberallin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants produced are gibberallin deficient, and have shortened hypocotyl and/or epicotyl phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1167

The protein, the genes that encode them and antisense DNAs are useful for regulating gibberellin activation, e.g. to inhibit elongative growth or to improve crop yield and management. They are useful for producing

new breeds of plants, for producing a higher harvest of feeding materia for animals and in plant regeneration. They are used to control the growth, size and shape of plants, e.g. dwarf plants, by inhibiting the gene, expression. The present sequence encodes a rice gibberellin 3beta-hydroxylase enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                    1038

The present sequence represents the C-20 oxidase polynucleotide sequence. In polynucleotide sequence is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Gibberellic acid levels may be control of gibberellic acid levels. Gibberellic acid levels may be controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberellin the pathway. Or chosynthetic pathway sequence, diverts substrate from the pathway, or degrades pathway substrates or products. The methods uses copally diphosphate synthase, 3beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta,3beta-hydroxylase polynucleotides to achieve this. The method is used to control seed germination and seedling growth especially to regulate gene products of gibberellin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants produced are gibberellin deficient, and have

```
The present sequence represent a gibberellic acid 2-oxidase 2 cDNA sequence, which is used in the method of the invention. The specification describes methods for the inhibition and control of gibberellic acid levels. Gibberellic acid levels may be inhibited or controlled by use of a chimeric expression construct expressing a RNA or protein which suppresses the gibberellin biosynthesic pathway sequence, diverts.

The methods uses copalyl diphosphate synthase, 3beta-hydroxylase, 2-oxidase, phytoene synthase, C-20 oxidase, and a 2beta, 3beta-hydroxylase polynucleotides to achieve this. The method is used to control seed germination and seedling growth especially to requilate gene products of gibberellin biosynthetic pathway and restoration of normal seed germination, in transgenic plants. The plants produced are gibberellin deficient, and have shortened hypocotyl and/or epicotyl phenotypes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1274 GATGAGCCGCCTGTCGCTGGAGCTGATGGAGGTGCTCGGGGAGAGCCTGGGCATCGTCGC 1333

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to nucleic acid molecules from Oryza sativa that encode proteins with gibberellin 3beta-hydroxylase activity. The protein, the genes that encode them and antisense DNRs are useful for regulating gibberellin activation, e.g. to inhibit elongative growth or to improve crop yield and management. They are useful for producing new breeds of plants, for producing a higher harvest of feeding materials for animals and in plant regeneration. They are used to control the growth, size and shape of plants, e.g. dwarf plants, by inhibiting the gene expression. The present sequence is genomic DNA encoding a gibberellin 3beta-hydroxylase enzyme.
                                                                                                                                                                                                                                                                                                                                        Rice, gibberellin 3beta-hydroxylase, growth inhibition, gene expression, crop yield, plant breeding; plant regeneration; growth control; ds.

                                                                                                                                                                                                                                                                                                                                                         3
                                                                                                                                                                                                                or to improve crop yield and management. They are useful for producing new breads of plants, for producing a higher harvest of feeding materials for animals and in plant regeneration. They are used to control the growth, size and shape of plants, e.g. dwarf plants, by inhibiting the apene expression. The present sequence encodes a rice gibberellin 3beta-hydroxylase enzyme of the invention.
                                                                        Rice-originated gibberellin Sapproximatelyb-hydroxylase and encoded genes for regulating gibberellin activation e.g. to inhibit elongative growth or to improve crop yield and management, applicable to produce
                                                                                                                                                             The invention relates to nucleic acid molecules from Oryza sativa that encode proteins with gibberellin 3beta-hydroxylase activity. The protein, the genes that encode them and antisense DNAs are useful for regulating gibberellin activation, e.g. to inhibit elongative growth

The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula [(Glya)X(Glyb)Y(Glyc)Z) m where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66, X, Y and Z need no
                                                                                                                                                                                    858
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       be identical from n repeat to n repeat. Alternatively a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          919 GTGAACCGGGGGAGAGACCGGATCTCCTTCCTTCCTCGGTCCGCCGGCGGCGATG

encoding the stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoinmune diseases, cancer and inflammation. In particular, the core protein may be an Ikappa regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in enzyme/produug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                932 GGTGGGGGAGGCGTGCGAGAGGCACGGCTTCTTCCTGGTGGTTAACCACGGCATCGAGGC 991
                                                                                                                                                                                                                                                                                                                                               The present sequence is that of DNA encoding the Epstein-Barr virus (EBV) nuclear antigen protein 1 (EBNA1, see AAY95856). EBNA1 is utilised in a novel method for obtaining a eukaryotic cell that is stably transfected with at least one episome. This method involves transfecting a eukaryotic cell with: (1) a first episome comprising an EBV origin of replication (orip, see AAA50253), a gene encoding a first protein whose expression results in cell death and a
                                                                                                                                                                                                                                          Stably transfecting eukaryotic cells with at least one episome for production of a desired protein in vitro and for gene therapy -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     First process marker for eukaryotic cells; and (2) a second episome comprising an EBV orip and a gene encoding a second protein, where expression of the second protein prohibits the occurrence of cell death resulting from expression of the first protein to produce doubly transfected cells which also express an antigen that promotes retention of the episomes by the cells. The doubly transfected cells are maintained under conditions in which the first and second proteins and the selectable marker are expressed, and the selective pressure specified by the marker is maintained. Under these conditions, only cells containing both episomes live. Preferably, EBNAl is expressed from 1 of the episomes, and the protein of interest from the other episome. Either or both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     establishment of exaryotic cells that stably and reliably express a gene of interest, using a novel method of selection, and maintenance of that selection without the need for exogenous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        epitopes may further comprise a nucleic acid sequence encoding a protein desired to be expressed in the cell (e.g. a therapeutic protein), a nucleic acid encoding an RNA that is not intended to be translated (e.g. a therapeutic RNA), or a DNA sequence used as a tag for the cells. The method is applicable to cell culture or intest organisms, for gene therapy. It allows the rapid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         752 GGTGGTGCAGCAGCAGGAGGTGTGCTTCGACGCGGCGGTGCTGAGCGGGCAGACGGA

```
protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral wector encodes a protein suitable for tethering DNA to Histone HI Methods for screening for compounds which are agonistic or antagonistic for the tethering of viral proteins to histone HI and DNA binding sites are useful for developing the method of viral transfer. The composition has applications to gene therapy, including the treatment of multiple sclerosis, parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Epstein-barr virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a composition comprising nucleic acid, histone H1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Histone H1; tethering protein; LANA; gene therapy; multiple sclerosis; Parkinson's disease; Huntington disease; diabetes; human herpesvirus 8; EBV; latency-associated nuclear antigen; LANA; EBNA1; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A composition for use in gene therapy comprises an expression vector that includes a nucleic acid sequence encoding a nucleic acid binding

Anote—Worker lambdalab; Site_1: EcoR1; Site_2: Xhol; Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Close, TJ Close). Whole spikes with awns trimmed were collected at 20 Dap (Fenton): Total RNA was prepared, poly(A) RNA was purified, one primary unamplified CDNA library was made, and 1 million pin were in vivo excised to give pBluescript SK(-) cDNA phagemids in the TJ Close lab at the University of California, Riverside (Choi). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Pelmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequence and wing). Plasmid DNA preparations, DNA sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. Whole spikes with awns trimmed were collected at 20 DaP (Fenton). Total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 1 million pit were in vivo excised to give phluescript SK(-) cDNA phagemids in the TJ Close lab at the University of California, Riverside (Choi). Phagemids were plated and picked at the Clemson University denomics Institute (CUGI) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phreed value 20 or above. For more details on library the preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 (bases 1 to 752)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (Choi, Close, Fenton). Phagemids were plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Arkins and Wing). Plasmid DNA preparations by BNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxine in covered crystallization dishes. Five-day old seedlings were incubated at Soc for 2 days. Shoots were then harvested, total RNA was prepared, poly(A) RNA was purified, one primary unamplified cDNA library was made, and 600000 pfu were in vivo excised to give pBluescript SK(-) cDNA phagemids. These steps were performed in the TJ Close laboratory at the University of California, Riverside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4;

                                                            Anote—Wetcor: lampda2AP; Site_1: EcoR1; Site_2: Xhol; Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Clase, TJ Close). Whole spikes with awns trimmed were collected at 5, 10, 15, 20, 30 and 45 DAP (Fenton). Fotal RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give palbuscript SK(-) bonk phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the Clemson University Genomics: Institute (CUG1) Regum. Palmer. Frisch, Akkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUG1 (Wing, TV, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or excession and experience and library preparation and

Seeds were surface sterilized then germinated under axenic conditions in the dark at room temperature on filter paper with water, nystatin and cefotaxime in covered crystallization dishes. Five-day old seedling shoots were then harvested, total RNA was prepared, poly (A) RNA was purpared, poly (A) RNA was purified, one primary unamplified cDNA library was made, and 1 million pfu were in vivo excised to give pBluescript SK(·) cDNA phagemids. These steps were performed in the TJ close laboratory at the University of California, Riverside (Choi, Close, Fenton). Phagemids were plated and picked at the Clemon Diversity enomics institute (CUGI) (Begum, Palmer, Filsch, Akkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and sequence analysis see

tests and pericarp were dissected from developing kernels at Washington State University, Pullman, WA (Kannangara, von Wetstein). Total RNA was prepared, poly(A) RNA was putified, one coRA library was made, and I million pfu were in vivo excised to give pBluescript SK(·) cDNA phagemids in the TJ Close lab at the University of California, Riverside (Akhunov, Chin, Choi, Close, Fenton, Kianian, Otto, Simons, Zhang). Phagemids mere plated and picked at the Clemson University Genomics Institute (CUGI) (Begum, Palmer, Frisch, Akkins and Wing). Plasmid DNA preparations, DNA sequence in Sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates , Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation, and sequence analysis see http://www.genome.clemson.edu/projects/parley. To order this clone see http://www.genome.clemson.edu/projects/parley. To order this clone see http://www.genome.clemson.edu/projects/parley. Genetically and physically anchored EST resources for barley genomics. Barley Genetics Newsletter 31:29-30. Anote-"Vector: landaraPp; Site_1: EcoR1; Site_2: Xhol;

Plants were raised from seeds in a Controlled Environments

growth chamber maintained in continuous light at 180c, and

testa and perioarp were dissected from developing Rernels

at Washington State University, Pullman, WA (Kannangara,

von Wetstein). Total RNA was prepared, poly(A) RNA was

purified, one cDNA library was made, and 1 million pfu

were in vivo excised to give pBluescript SK(-) cDNA

phagemids in the TJ Close lab at the University of

california, Riverside (Akhunov, Chin, Choi, Close, Fenton,

Kianian, Otto, Simons, Zhang). Phagemids were plated and

picked at the Clemson University Genomics Institute (CUGI)

(Begum, Palmer, Frisch, Aktins and Wing). Plasmid DNA

preparations, DNA sequence has been trimmed to remove

vector sequence and contains a minimum of 100 bases of

phred value 20 or above. For more details on library

preparation and sequence analysis see
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Hordeum volgate:

                                                                                                                                                                                                                                      Plants were grown in the greenhouse at the University of California, Riverside (Fenton, SJ Close, TJ Close). Whole spikes with awns trimmed were collected at 5, 10, 15, 20, 30 and 45 DAP (Fenton). Total RNA was prepared from each pool, equal quantities of all six RNA pools were combined, poly(A) RNA was purified from the mixture, one primary unamplified compared from the mixture, one primary unamplified or secised from the mixture, one primary in vivo excised to give pBluescript SK(-) CoMPA phagemids (Choi)in the TJ Close lab at the University of California, Riverside. Phagemids were plated and picked at the clemson University Genomics Institute (CUGI) (Regum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Midy, YY, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence
